

cadarn talon

THE COMPANY

The company is privately owned and based in Cardiff, Wales, UK. The name cadarn is taken from the Welsh language, meaning strong or mighty.

The multiple award winning Cadarn Talon is a very simple to use and robust line attachment device which has been designed especially for the maritime market. It can serve a multitude of applications, as it enables a line to be quickly attached to a person or object, making the perfect mooring and rescue device.

Talon can be effortlessly attached to various items, such as a cleat, ring, bar, webbing strap, or rope, up to 45 mm in diameter. It has been specifically designed to insert onto the most common types of boat hooks without any need for modification. When used in conjunction with a typical boat hook, or any suitable size pole, the device operating range can be extended for remote attachment and detachment without having to leave the deck. Picking up and releasing from a mooring is made easier and much safer.

The unique design means it is just as easily used directly in hand or detached and recovered Remotely with a boat hook. It is operated single handily, essential for short-handed or solo crews; equally no cooperation from the casualty is necessary. The Talon design also incorporates a sturdy grip for hand operation and also for assisting in lifting of the object or person.

Solidly constructed from stainless steel, the Talon is extremely robust and has been designed to be used extensively within the harsh marine environment. The product is easily stripped for cleaning and all components are replaceable in the unlikely event that it was ever damaged. Its compact size and light weight means it can be easily carried in hand luggage, ideal for that overseas charter or delivery trip.

Talon is so versatile that it can be used as a mooring aid one moment and then be readily at hand to help deal with an emergency. Amongst the many other uses are confined space rescue or river and ice rescue. It could even hook onto a pet collar and is ideal for attaching to underwater objects by a diver and in an emergency their dive buddy.
